

**Imperial Exposure Meter. The Imperial Dry Plate Co.,
Limited, Cricklewood, N.W.**

Most users of meters have experienced difficulty in securing accurate ideas of exposure when working in interiors or in a very bad light, and the Imperial Dry Plate Company have now supplemented their standard meter by a second one, specially adapted for use in bad conditions of light. The only differences in this new edition of the meter are the use of a much lighter matching tint, and of a modified time of exposure scale, in which the times marked appear to be about four times as great as those on the original or No. 1 meter. The test paper used is the same, and the manipulation of the No. 2 instrument is exactly similar to that of the other; therefore the photographer has nothing more to learn except when to use No. 1, and when to use No. 2 meter. In regard to this point the makers say that when the time taken to match the tint in the No. 2 meter is less than 20 to 25 seconds, then No. 1 meter should be used. The Imperial meter is well known, and its simplicity fully appreciated, so the new introduction should be well received. It can either be bought separately at 1s., the same price as the older one, or the two can be obtained bound together in leather, a highly convenient form, for 2s. 6d.
